

IN THE CLAIMS

1. (Canceled)

2-3. (Canceled)

4-6. (Canceled)

7. (Previously Presented) A method to deliver enhanced content to a set-top box, the method comprising:

receiving a trigger included in a video signal input at the set-top box which indicates that enhanced content is available;

establishing a communication link between a server and said set-top box, the server hosting different versions of enhanced content compatible with a plurality of different types of set-top boxes;

sending a signal from said set-top box to said server through said communication link;

decoding a signal header at said server;

based on the decoded signal header, establishing the set-top box type;

transmitting the enhanced content corresponding to the type of the set-top box; and

receiving the enhanced content at the set-top box to generate an enhanced display.

8. (Previously Presented) The method of claim 7 wherein said trigger is located in a vertical blanking interval of the video signal input.

9. (Previously Presented) The method of claim 7 wherein said trigger is a command string written in Advanced Television Enhancement Forum compliant code.

10. (Previously Presented) The method of claim 7 wherein said communication link is Hyper Text Transfer Protocol.

11-14. (Canceled)

15. (Previously Presented) A system to deliver enhanced content to a set-top box, the system comprising:

a set-top box to receive a trigger encoded in a video signal to indicate that enhanced content is available, and, in response to said trigger, to send a signal containing header information conveying type and location information of the set-top box; and

a server hosting different versions of enhanced content compatible with a plurality of different types of set-top boxes, the server to receive the signal and to respond to the signal by transmitting enhanced content to the set-top box

wherein the set-top box is to receive the enhanced content and generate an enhanced display.

16. (Canceled)

17. (Previously Presented) The system of claim 15 wherein the server responds to said signal from said set-top box and only transmits a version of the enhanced content compatible with the type of said set-top box.

18. (Previously Presented) The system of claim 15 wherein said trigger is located in a vertical blanking interval of the video signal input.

19. (Original) The system of claim 15 wherein said trigger is a command string written in Advanced Television Enhancement Forum compliant code.

20. (Original) The system of claim 15 wherein said communication link is Hyper Text Transfer Protocol.
